Script-Controlled ACL Problem Statement Template:

Create a problem statement to understand the user's point of view on record access. The Script-Controlled ACL Problem Statement template helps you focus on what matters when securing the Institution Details (u_institution_details) records, so that every user sees only the records they are meant to see.

A well-articulated problem statement allows you and your team to design the right Script-Controlled ACL. The ACL uses a custom script that checks field values (such as Branch) and user conditions (such as roles) before granting access, and users can access the record only when the ACL script evaluates to true.

I am	<i>Describe the user with 3-4 key traits - role, branch, access level.</i>	A ServiceNow administrator or EEE branch user with a custom role (bb1 to bb4) working with student records
I'm trying to	<i>List the record access they need - view, create, edit or delete.</i>	Access Institution Details records only when the ACL script evaluates to true for their role and Branch value
but	<i>Describe what blocks or exposes access - what bothers them most?</i>	Users from other branches can see or change records, or valid users are blocked from them
because	<i>Root cause - why the ACL script or role setup fails to control access.</i>	The ACL script does not check the Branch field together with the user's roles
which makes me feel	<i>Describe how the access problem impacts them emotionally.</i>	Worried about data exposure and frustrated when access does not work

Reference: <https://miro.com/templates/customer-problem-statement/>

Example:

I am	I'm trying to	But	Because	Which makes me feel
an EEE branch user	view only EEE branch records	other branches' records are visible	The ACL script does not check the Branch field	Worried

Problem Statement (PS)	I am (Customer)	I'm trying to	But	Because	Which makes me feel
PS-1	A ServiceNow system administrator responsible for protecting student data in the Institution Details table	Make sure users can view only the records they are meant to see, such as only EEE branch records	Standard role checks alone let users see records from other branches (ECE, CSE) as well	The ACL does not check the record's Branch field together with the user's role, so there is no script deciding true or false	Worried that sensitive student data is exposed to unauthorised users
PS-2	An EEE branch staff member (with the bb1 role) who manages student records	View and manage only EEE branch records, and create, edit or delete them when permitted	Records are hidden or actions like New, edit and delete are blocked, or other users see more than they should	Read, Create, Write and Delete ACLs are not separated by role (bb1 to bb4) and the script does not return true for the right users	Frustrated and unsure whether access rules are working correctly

Problem Statement Summary:

How might we use a script-controlled ACL on the u_institution_details table so that access to a record is granted only when the script, which checks the Branch field value and the user's roles, evaluates to true?
